Executive Summary

UDOT continues to have success lowering the numbers and rates of serious and fatal injury crashes. The statewide 5-year rolling averages show steady declines from 2008 through 2012. The decline of serious and fatal injury crashes holds true for nearly all crash types, roadway functional classifications, roadway ownership (State and non-State) categories, and SHSP focus areas. Because the declines have been so large, UDOT will have to continually find ways in the future to identify targeted construction projects and non-infrastructure programs to sustain the downward trend. To that end, UDOT is embarking on several efforts to strengthen its ability to identify safety projects on all roads in the state as well as to find and correct systemic conditions that correlate with serious and fatal injury crashes.
Introduction

The Highway Safety Improvement Program (HSIP) is a core Federal-aid program with the purpose of achieving a significant reduction in fatalities and serious injuries on all public roads. As per 23 U.S.C. 148(h) and 23 CFR 924.15, States are required to report annually on the progress being made to advance HSIP implementation and evaluation efforts. The format of this report is consistent with the HSIP MAP-21 Reporting Guidance dated February 13, 2013 and consists of four sections: program structure, progress in implementing HSIP projects, progress in achieving safety performance targets, and assessment of the effectiveness of the improvements.

Program Structure

Program Administration

How are Highway Safety Improvement Program funds allocated in a State?

- [ ] Central
- [ ] District
- [ ] Other

Describe how local roads are addressed as part of Highway Safety Improvement Program.

Local roads are eligible for HSIP funds if projects meet program requirements. However, UDOT lacks linear referencing systems and other information about local roads (non-State and non-Federal Aid) that would make it easier to compare relative safety needs on State roads and local roads, especially for systemic treatments. UDOT does perform crash analysis on non-State Federal Aid routes and accept applications from local agencies for HSIP funding consideration.

Identify which internal partners are involved with Highway Safety Improvement Program planning.
Briefly describe coordination with internal partners.

Infrastructure Project selection Criteria
The process that UDOT uses to address the emphasis areas outlined in the Utah Strategic Highway Safety Plan is divided into the following five sections; Planning, Analysis, Prioritization, Programming, and Implementation.

Planning
UDOT uses two methods to plan HSIP projects. For the first method, each UDOT region sends an annual submittal to the Traffic & Safety Division that identifies their priority projects for HSIP funding consideration. The Traffic & Safety Division then screens the crash data, traffic data, and input from the region offices. A meeting is then held with each region office to identify potential spot safety locations based on the screened data and the region submittals. For the second method, the Traffic & Safety Division employs a systemic approach to identify projects. This is done by looking at crash and roadway attribute data from a statewide perspective.

Analysis
A three-year crash history is compiled for each candidate location. Crash characteristics are analyzed and potential measures to mitigate those characteristics are identified. Benefit-to-cost ratios are calculated for each location based on crash history, expected decrease in crashes for a potential mitigation measure, and cost of that mitigation measure. The Traffic & Safety Division conducts a formal meeting with each region to review potential HSIP project locations. Traffic and Safety Division staff, an FHWA representative, and various region staff attend these
review meetings.

**Prioritization**
Prioritization is based on the following factors and is conducted by the Traffic & Safety Division:
- Greatest benefit to reduce fatal & serious injury crashes
- Benefit-to-cost ratio
- Timeline to completion
- Coordination with other projects

**Programming**
Each project is assigned a specific funding year within a three-year planning horizon and is set up in UDOT’s project management system. Because the planning horizon covers a three-year period but is re-evaluated annually, it is possible for re-prioritization of funding to occur periodically. This may result in modified or new projects with higher priorities taking the place of previously programmed projects. The Traffic & Safety Division conducts the programming process.

**Implementation**
After projects are programmed, project managers from the applicable UDOT region offices are assigned to each project. These project managers then shepherd the projects through UDOT's standard federal environmental, design, and construction processes.

Identify which external partners are involved with Highway Safety Improvement Program planning.

- Metropolitan Planning Organizations
- Governors Highway Safety Office
- Local Government Association
- Other: Other-SHSP Partners

Identify any program administration practices used to implement the HSIP that have changed since the last reporting period.
Multi-disciplinary HSIP steering committee

☑ Other: Other - UDOT has adapted to the new processes associated with MAP-21

Describe any other aspects of Highway Safety Improvement Program Administration on which you would like to elaborate.

UDOT focuses its infrastructure improvements primarily on the Roadway Departure Crashes, Drowsy Driving, Distracted Driving, and Intersection Safety emphasis areas. The other emphasis areas (Public Outreach and Education, Use of Safety Restraints, Impaired Driving, Aggressive Driving, Teen Driving Safety, Motorcycle Safety, and Speed Management) are addressed primarily through non-infrastructure efforts such as education, media, and enforcement campaigns. UDOT partners with other state, local, and federal agencies to implement the non-infrastructure components of the UCSP. A "Zero Fatalities" goal (ut.zerofatalities.com) is also part of the UCSP.

Program Methodology
Select the programs that are administered under the HSIP.

☐ Median Barrier ☐ Intersection ☐ Safe Corridor
☐ Horizontal Curve ☐ Bicycle Safety ☐ Rural State Highways
☐ Skid Hazard ☐ Crash Data ☐ Red Light Running Prevention
☐ Roadway Departure ☒ Low-Cost Spot Improvements ☐ Sign Replacement And Improvement
☐ Local Safety ☐ Pedestrian Safety ☐ Right Angle Crash
☐ Left Turn Crash ☐ Shoulder Improvement ☐ Segments
☒ Other: Other - Reduce Serious Injury & Fatal Crashes
Program: Low-Cost Spot Improvements

Date of Program Methodology: 4/1/2011

What data types were used in the program methodology?

**Crashes**
- [x] All crashes
- [ ] Fatal crashes only
- [x] Fatal and serious injury crashes only
- [ ] Other

**Exposure**
- [ ] Traffic
- [x] Volume
- [ ] Population
- [x] Lane miles
- [ ] Other

**Roadway**
- [x] Median width
- [x] Horizontal curvature
- [x] Functional classification
- [x] Roadside features
- [ ] Other

What project identification methodology was used for this program?

- [x] Crash frequency
- [ ] Expected crash frequency with EB adjustment
- [ ] Equivalent property damage only (EPDO Crash frequency)
- [ ] EPDO crash frequency with EB adjustment
- [x] Relative severity index
- [x] Crash rate
- [x] Critical rate
- [ ] Level of service of safety (LOSS)
- [ ] Excess expected crash frequency using SPF
Excess expected crash frequency with the EB adjustment
Excess expected crash frequency using method of moments
Probability of specific crash types
Excess proportions of specific crash types
Other

Are local roads (non-state owned and operated) included or addressed in this program?

Yes
No

If yes, are local road projects identified using the same methodology as state roads?

Yes
No

If no, describe the methodology used to identify local road projects as part of this program.

We do not currently have tools to do network screening on local roads based on the physical characteristics of the roadway. However, since 2012 UDOT geospacially locates all crashes on every public road.

How are highway safety improvement projects advanced for implementation?

Competitive application process
selection committee
Other

Select the processes used to prioritize projects for implementation. For the methods selected, indicate the relative importance of each process in project prioritization. Enter either the weights or numerical rankings. If weights are entered, the sum must equal 100. If ranks are entered, indicate ties by giving both processes the same rank and skip the next highest rank (as an example: 1, 2, 2, 4).

Relative Weight in Scoring
Rank of Priority Consideration

- Ranking based on B/C 20
- Available funding 20
- Incremental B/C
- Ranking based on net benefit 20
- Cost Effectiveness
- Time to Completion 20
- Coordination with other Projects 20

Program: Other-Reduce Serious Injury & Fatal Crashes

Date of Program Methodology: 10/1/2011

☒ Excess proportions of specific crash types
☐ Other

**Are local roads (non-state owned and operated) included or addressed in this program?**
☒ Yes
☐ No

If yes, are local road projects identified using the same methodology as state roads?
☐ Yes
☒ No

If no, describe the methodology used to identify local road projects as part of this program.

A project identification report (PIR) process is being used this year to identify and scope projects on non-State federal aid routes. This process consists of contracting with an engineering firm to perform an RSA at high-crash locations.
How are highway safety improvement projects advanced for implementation?

☒ Competitive application process
☐ selection committee
☐ Other

Select the processes used to prioritize projects for implementation. For the methods selected, indicate the relative importance of each process in project prioritization. Enter either the weights or numerical rankings. If weights are entered, the sum must equal 100. If ranks are entered, indicate ties by giving both processes the same rank and skip the next highest rank (as an example: 1, 2, 2, 4).

☒ Relative Weight in Scoring

☒ Ranking based on net benefit 20
☐ Cost Effectiveness
☒ Timeline to completion 20
☒ Coordination with other projects 20

What proportion of highway safety improvement program funds address systemic improvements?

50

Highway safety improvement program funds are used to address which of the following systemic
improvements?

- Cable Median Barriers
- Rumble Strips
- Traffic Control Device Rehabilitation
- Pavement/Shoulder Widening
- Install/Improve Signing
- Install/Improve Pavement Marking and/or Delineation
- Upgrade Guard Rails
- Clear Zone Improvements
- Safety Edge
- Install/Improve Lighting
- Add/Upgrade/Modify/Remove Traffic Signal
- Other

What process is used to identify potential countermeasures?

- Engineering Study
- Road Safety Assessment
- Other:

Identify any program methodology practices used to implement the HSIP that have changed since the last reporting period.

- Highway Safety Manual
- Road Safety audits
- Systemic Approach
Describe any other aspects of the Highway Safety Improvement Program methodology on which you would like to elaborate.

Non-Infrastructure Projects
UDOT uses some of its HSIP funding for non-infrastructure projects that aid roadway safety efforts. Such projects include:

Educational Campaigns
Zero Fatalities is a mutual effort between various state safety partners to address the top behaviors that lead to fatalities on Utah's roads. The program targets behaviors such as drowsy driving, distracted driving, aggressive driving, impaired driving, and lack of seatbelt usage.

Integrating Safety Into Planning
UDOT Traffic & Safety Division personnel work internally with other UDOT divisions to integrate safety planning into their core processes. UDOT also works with MPOs and other safety partners across the state to supply them with needed data and tools so they can better integrate safety into their internal planning processes. UDOT continues to partner with the MPOs in order to provide them with tools to incorporate safety into their transportation planning efforts. Integrating safety into UDOT and MPO planning processes helps all agencies proactively address safety.

Improving Crash Data Analysis
HSIP funding is also used to improve UDOT's crash database. The ability to accurately locate crashes and understand crash characteristics is vital to programming HSIP funds.

University & Consultant Support
The Traffic & Safety Division uses HSIP funding to contract with universities and consultants who assist with various HSIP functions. The functions include items such as program management, project management, crash data mapping, statistical analysis, safety modeling, report preparation, SPF/CMF development, training, and HSM analysis.
### Progress in Implementing Projects

How much funding is programmed to local (non-state owned and maintained) safety projects?
$650,000.00

How much funding is obligated to local safety projects?
$50,000.00

How much funding is programmed to non-infrastructure safety projects?
$2,500,000.00

How much funding is obligated to non-infrastructure safety projects?
$2,500,000.00

How much funding was transferred in to the HSIP from other core program areas during the reporting period?
$6,877,810.00
How much funding was transferred out of the HSIP to other core program areas during the reporting period?

$0.00

Discuss impediments to obligating Highway Safety Improvement Program funds and plans to overcome this in the future.

Our biggest obstacle to obligating HSIP funds this past year was the addition of the Section 164 penalty transfer funds. We obligated enough money to cover the normal HSIP allocation but did not anticipate the extra Section 164 funds when doing program planning. We will work on getting those funds obligated for next year so that we don’t have so much money left to obligate.

Another obstacle this past year was favorable construction bids. Many large HSIP-funded projects were awarded at far below their cost estimates, which resulted in millions of dollars being returned to the program. UDOT continues to refine its cost estimation practices and strive for more accurate bidding.

Describe any other aspects of the general Highway Safety Improvement Program implementation progress on which you would like to elaborate.

Project delivery is administered through the UDOT region offices. We are working closely with our region counterparts to make sure safety projects are addressed in a timely manner. After projects are programmed, project managers from the applicable UDOT region offices are assigned to each project. These project managers then shepherd the projects through UDOT’s standard federal environmental, design, and construction processes.

Data for the years 2008 to 2012.
Fatality Rate by Roadway Ownership
Serious Injury Rate by Roadway Ownership

2008  2009  2010  2011  2012

Roadway Functional Classification

Serious Injury Rate (per HIIVMT)
Several assumptions were made to calculate these totals.

1) Crashes by functional class is not available prior to 2006. Thus, the 2008 rolling average is for only 3 years and 2009 is for only 4 years. Everything from 2010 onward is a true 5-year rolling average.

2) HMVMT information broken down by functional class and ownership is not yet available from UDOT for 2012. As a result, we made the assumption that 2012 HMVMT levels were equal to 2011 values.
Describe any other aspects of the general highway safety trends on which you would like to elaborate.

Overall, serious injury and fatality rates continue to decline in Utah. Serious injury rates have been reduced on a statewide basis by approximately 50% (on a rolling 5-year basis) from 2008 to 2012. Fatality rates have been reduced by approximately 15%.

When broken down by functional class, all classifications have experienced steady declines in serious injury rates. All urban functional classifications have seen a steady decline in fatal injury rates (except for urban local streets, which has remained constant but makes up a miniscule part of the crash totals). However, several rural functional classifications have experienced consistent or rising fatal injury rates. Fatality rates for rural minor arterials, rural major collectors, and rural local streets (which comprise a very small part of the total fatalities) have all grown over the past five years. It should be noted that decreases in urban fatality rates far offset the small increases that have occurred on these rural road classifications so that overall fatality rates across the state have decreased significantly.

When broken down by State system roads and non-State system roads, both categories show steady decreases (approximately 50% for fatal injury rates and 15% for serious injury rates) in crash rates.

**Application of Special Rules**

**Present the rate of traffic fatalities and serious injuries per capita for drivers and pedestrians over the age of 65.**

*Performance measure data is presented using a five-year rolling average.*

We followed the method outlined on FHWA’s Older Drivers and Pedestrians Special Rule website. Rolling 5-year averages were calculated separately for both the older driver fatal/serious injury crashes and the 65+ age group per thousand of people in the state. The rolling crash average was divided by the rolling age group average and that yielded the older
driver crash rate per thousand population. Only rates for 2009, 2010, and 2011 are provided. This is because the age group information provided on FHWA's website begins in 2005 and ends in 2011, thereby making it impossible to calculate rolling averages for 2008 and 2012 based on the data provided.

Rate of Fatalities and Serious Injuries for the Last Five Years

Does the older driver special rule apply to your state?

No
Assessment of the Effectiveness of the Improvements (Program Evaluation)

What indicators of success can you use to demonstrate effectiveness and success in the Highway Safety Improvement Program?

☐ None

☐ Benefit/cost

☐ Policy change

☒ Other: Other-Reduction in serious and fatal injury crashes
What significant programmatic changes have occurred since the last reporting period?

- Shift Focus to Fatalities and Serious Injuries
- Include Local Roads in Highway Safety Improvement Program
- Organizational Changes
  - None
  - Other: Utilization of HSM methods for network screening and also corridor analysis
  - Other: Development of better analytical/modeling tools to help identify both systemic crash trends and site-specific issues
  - Other: Intensive data collection effort to obtain roadway assets that aid in systemic analysis
Briefly describe significant program changes that have occurred since the last reporting period.

1) UDOT has continued to work with BYU to develop a statewide crash model capable of identifying systemic trends as well as locations where certain crash types are over-represented.

2) All crash data is now geospatially located - even crashes that are not on the State system.

3) UDOT began implementing HSM methods to perform network screening as well as evaluate alternatives for safety improvements in specific corridors.
SHSP Emphasis Areas
For each SHSP emphasis area that relates to the HSIP, present trends in emphasis area performance measures.

2008 2009 2010 2011 2012
Most of our low-cost spot improvements have been rumble strips and median barrier, both of which target run-off-road crashes. For this reason, we estimated the impact of that program by using the "Roadway Departure" crash totals.

The only other real sub-program that UDOT does is "reducing fatal and serious injury crashes" and we used the overall crash totals to estimate that.

For both categories, 2012 HMVMNT was assumed to be the same as 2011 values since UDOT does not yet have official 2012 HMVMNT data available.

# Serious Injuries by Target Crash Type for Systemic Safety Improvements

Year 2008 to Year 2012
Most of our systemic safety improvements have been geared toward mitigating run-off-road crashes, so we used the "Roadway Departure" crash type to estimate our impact on systemic crash types.
Describe any other aspects of the overall Highway Safety Improvement Program effectiveness on which you would like to elaborate.

As has been demonstrated in the other questions, Utah continues to experience a downward trend in overall serious and fatal injury crashes. Also, nearly all individual crash categories (whether broken down by crash type, road ownership, SHSP emphasis area, etc) have experienced declines. As fatalities continue to be reduced it will become more difficult to find projects that have a large impact on improving safety. UDOT will need to be vigilant about continuing to identify ways to further reduce serious and fatal injury crashes.
Provide project evaluation data for completed projects (optional).

**Glossary**

**5 year rolling average** means the average of five individual, consecutive annual points of data (e.g. annual fatality rate).

**Emphasis area** means a highway safety priority in a State’s SHSP, identified through a data-driven, collaborative process.

**Highway safety improvement project** means strategies, activities and projects on a public road that are consistent with a State strategic highway safety plan and corrects or improves a hazardous road location or feature or addresses a highway safety problem.

**HMVMT** means hundred million vehicle miles traveled.

**Non-infrastructure projects** are projects that do not result in construction. Examples of non-infrastructure projects include road safety audits, transportation safety planning activities, improvements in the collection and analysis of data, education and outreach, and enforcement activities.

**Older driver special rule** applies if traffic fatalities and serious injuries per capita for drivers and pedestrians over the age of 65 in a State increases during the most recent 2-year period for which data are available, as defined in the Older Driver and Pedestrian Special Rule Interim Guidance dated February 13, 2013.

**Performance measure** means indicators that enable decision-makers and other stakeholders to monitor changes in system condition and performance against established visions, goals, and objectives.

**Programmed funds** mean those funds that have been programmed in the Statewide Transportation Improvement Program (STIP) to be expended on highway safety improvement projects.

**Roadway Functional Classification** means the process by which streets and highways are grouped into classes, or systems, according to the character of service they are intended to provide.

**Strategic Highway Safety Plan (SHSP)** means a comprehensive, multi-disciplinary plan, based on safety data developed by a State Department of Transportation in accordance with 23 U.S.C. 148.

**Systemic safety improvement** means an improvement that is widely implemented based on high risk roadway features that are correlated with specific severe crash types.

**Transfer** means, in accordance with provisions of 23 U.S.C. 126, a State may transfer from an apportionment under section 104(b) not to exceed 50 percent of the amount apportioned for the fiscal year to any other apportionment of the State under that section.
