Protection of Data from Discovery & Admission into Evidence

23 U.S.C. 148(h)(4) states “Notwithstanding any other provision of law, reports, surveys, schedules, lists, or data compiled or collected for any purpose relating to this section [HSIP], shall not be subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location identified or addressed in the reports, surveys, schedules, lists, or other data.”

23 U.S.C. 409 states “Notwithstanding any other provision of law, reports, surveys, schedules, lists, or data compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential accident sites, hazardous roadway conditions, or railway-highway crossings, pursuant to sections 130, 144, and 148 of this title or for the purpose of developing any highway safety construction improvement project which may be implemented utilizing Federal-aid highway funds shall not be subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.”

Executive Summary

The Moving Ahead for Progress in the 21st Century Act or “MAP–21” (Pub. L. 112–141, 126 Stat. 405), was signed into law July 6, 2012, and continued the Highway Safety Improvement Program (HSIP) as a core program under title 23 United States Code section 148 to reduce fatalities and injuries on all public roadways. Title 23 United States Code section 148(h) requires each state to submit an annual report to the Federal Highway Administration (FHWA) regarding its HSIP implementation and effectiveness and title 23 Code of Federal Regulations sections 924.15(a)(1) and 924.15(a)(2) specify that the report be submitted no later than August 31 of each year.

This annual report describes the progress being made to implement projects and the status of program evaluations for the HSIP as described in Title 23 United States Code section 148, and for High-Risk Rural Roads (HR3) (23 U.S.C. § 148(g)). The Railway-Highway Crossings (23 U.S.C. § 130(g)) report is submitted to FHWA directly by the California Public Utility Commission as a separate report.

Under the “MAP–21” (Pub. L. 112–141, July 6, 2012; 126 Stat. 405), the High-Risk Rural Roads program was merged into the HSIP for safety improvements on public rural roadways that meet the functional classification requirements of title 23 United States Code section 148(a)(1). In addition to the above, in accordance with title 23 United States Code section 164 repeat intoxicated transfer funds, approximately $35.21 million was obligated for alcohol impaired driving countermeasures. These funds will be used to support the California Strategic Highway Safety Plan.

Caltrans’ Division of Traffic Operations provided information on the State Highway System (SHS) for this report, and Caltrans’ Division of Local Assistance for local roads and the HR3 Program. Caltrans implements the HSIP for State highways by programming and funding projects in the Collision Reduction Category, one of eight categories that make up the State Highway Operation and Protection Program (SHOPP). The Collision Reduction Category is further divided into two programs: Safety Improvement, and Collision Severity Reduction. The Safety Improvement Program is among Caltrans’ top priorities in the SHOPP and as a result, all projects that meet the criteria for the Safety Improvement Program are funded. These criteria include a benefit-cost analysis. The projects evaluated in this report are funded by the Collision Reduction Category, which includes both federal HSIP and State highway funds.
Caltrans uses the Transportation System Network (TSN) database to identify locations with significantly high collision concentrations. The identified locations are systematically investigated to determine probable causes of the collisions in order to implement effective countermeasures to improve safety. Other locations identified for investigation and possible implementation of countermeasures are generated from three Monitoring Programs: Cross Median Collision, Two and Three Lane Cross Centerline Collision, and Wrong Way Collision. Nearly 2,468 traffic safety investigations were processed between 01-01-2014 and 12-31-2014. In addition, 528 “Other Safety” investigations were processed. These safety related investigations were not generated by TSN but by citizens’ calls, letters, emails, etc. Finally, as of February, 2012, Caltrans has implemented a 5-year “California Roadway Departure Safety Implementation Plan” which identified over 7,000 locations for possible low cost countermeasures to systematically implement on many state highways in an effort to reduce roadway departure crashes.

For this year’s reporting period, the most recent ten-year data available was for 2003 to 2012. During the 2012 calendar year, 1,049 fatal collisions, 47,426 injury collisions, and 90,182 property-damage-only (PDO) collisions were reported on the SHS. Caltrans estimates that these collisions resulted in losses of approximately $20.6 billion.

The HSIP and other State programs have made highways safer through the implementation of highway safety projects. This fact is evident from the fatality rate trends. Between 2003 and 2012, the fatality rate on all State highways has decreased 38 percent. For the same period, the fatality rate on freeways decreased 40 percent, and on non-freeways it decreased 32 percent. During the same period, the annual travel increased by 0.2 percent on all highways. The annual travel on freeways increased 1.8 percent, and on non-freeways it decreased by 6.8 percent. Freeway travel in 2012 accounts for 82.9 percent of travel on the SHS even though freeway road miles account for only 29 percent of the SHS.

The reductions in fatality rates have been accomplished by implementing safety projects. Many other improvements such as tree trimming, restriping, or installing warning signs that were requested by Traffic Operations staff and performed by Maintenance staff in the districts also contributed to improved safety. During FY 2014/15, there were 61 Major and Minor-A safety projects awarded at a cost of $100.85 million. All of these project types are consistent with one or more of the 17 challenge areas identified in California’s Strategic Highway Safety Plan (SHSP).

The effectiveness of the State HSIP was measured by comparing collision data before and after safety improvements were implemented at project sites. These projects have been completed between 7/1/2010 and 6/30/2011. Three years of collision data before project implementation was compared with three years of collision data after project implementation. A total of 78 projects were considered in the evaluation. Analysis of collision data was based on 110 highway
locations as some of the projects contained more than one highway location. The cost of implementing these projects was $119.4 million. The annual savings, in terms of reductions in collision frequency and severity, was estimated at $78.3 million. This translates to a savings of $1565.2 million or a benefit-cost ratio of 13.1 to 1, assuming a project life of 20 years.

A set of 4 performance measures were calculated for California highways including state and local roads. The performance measures were defined as 5 year rolling average of collision frequencies and collision rates for each of the five years, 2008 thru 2012. These performance measures are: 1) the number of fatalities, 2) the number of fatalities per 100 Million Vehicle Mile of Travel (MVMT), 3) the number of persons severely injured, and, 4) the number of persons severely injured per 100 MVMT. The data used to derive the rolling averages is from 2003 to 2012. The rolling averages show a decreasing trend, indicating improvement in road safety on California state and local roads.

MAP-21 is putting focus in certain areas such as older driver and pedestrian fatalities and severe injury rates per capita. Comparison of the 5 year rolling averages for older driver and pedestrian fatal + injury are done for two time periods, 2006-2008 and 2008-2012. The most recent data available was for 2012. Using these two time periods, the moving averages for fatal + injury show a downward trend and therefore the implementation of the special rule as set by MAP 21 does not apply. The data are from all roadways in the state, not just the State Highway System.
Introduction

The Highway Safety Improvement Program (HSIP) is a core Federal-aid program with the purpose of achieving a significant reduction in fatalities and serious injuries on all public roads. As per 23 U.S.C. 148(h) and 23 CFR 924.15, States are required to report annually on the progress being made to advance HSIP implementation and evaluation efforts. The format of this report is consistent with the HSIP MAP-21 Reporting Guidance dated February 13, 2013 and consists of four sections: program structure, progress in implementing HSIP projects, progress in achieving safety performance targets, and assessment of the effectiveness of the improvements.

Program Structure

Program Administration

How are Highway Safety Improvement Program funds allocated in a State?

- Central
- District
- Other

Describe how local roads are addressed as part of Highway Safety Improvement Program.

Caltrans Division of Local Assistance (DLA) uses an HSIP application benefit-cost tool to provide a consistent, data-driven methodology for ranking local roadway (non-State owned and operated) project applications on a statewide basis. This tool was developed by the DLA in conjunction with the University of California, Berkeley, Safe Transportation Research and Education Center. The DLA HSIP also provides the Local Roadway Safety Manual for California local road owners and directly incorporates UC Berkeley’s Transportation Injury Mapping System website to assist applicants applying for local HSIP funds. These tools and resources encourage local agencies to proactively analyze their roadway networks for the highest
crash locations and develop and submit applications with the greatest chance of reducing fatalities and serious injuries.

**Identify which internal partners are involved with Highway Safety Improvement Program planning.**

- [ ] Design
- [x] Planning
- [ ] Maintenance
- [x] Operations
- [ ] Governors Highway Safety Office
- [x] Other: Other-Headquarters Traffic Safety and Mobility Program, in partnership with 12 district offices, plans safety projects on the state highway system. Caltrans Division of Local Assistance in conjunction with local agencies, plans projects on local roads.

**Briefly describe coordination with internal partners.**

On the State Highway System, the Traffic Safety and Mobility Program in Headquarters within the Division of Traffic Operations works with the 12 Caltrans district offices to develop Project Initiation Documents to program projects. For local roads, Caltrans Division of Local Assistance (DLA) staff manage the local agency share of HSIP funds in conjunction with its local agency partners. The DLA prepares the HSIP guidelines and solicits project applications from local agencies.

**Identify which external partners are involved with Highway Safety Improvement Program planning.**

- [x] Metropolitan Planning Organizations
- [x] Governors Highway Safety Office
- [x] Local Government Association
- [x] Other: Other-Caltrans has been working with 400 stakeholders from 170 public & private agencies to develop CA-SHSP. Projects developed are consistent with SHSP strategies. Caltrans’ DLA with local
agencies are involved in planning projects on local roads.

Identify any program administration practices used to implement the HSIP that have changed since the last reporting period.

☐ Multi-disciplinary HSIP steering committee

☒ Other: Other-The California Local HSIP Advisory Committee was established. This is an action oriented committee of transportation safety stakeholders which supports the goal to reduce fatalities and serious injuries on all public roadways in California.

Describe any other aspects of Highway Safety Improvement Program Administration on which you would like to elaborate.

Eligibility of HSIP funds under MAP-21 now includes more flexibility in the types of projects and States are no longer required to certify they have met various safety infrastructure needs in order to fund non-infrastructure projects. An HSIP project is now any strategy, activity or infrastructure and non-infrastructure types of project on a public road that is consistent with the State's data-driven Strategic Highway Safety Plan (SHSP) and must support the State’s safety performance targets. HSIP continues to focus on significantly reducing traffic fatalities and serious injuries on all public roads. HSIP also continues to require a data-driven, strategic approach to improving highway safety on all public roads.

Program Methodology
Select the programs that are administered under the HSIP.

☒ Median Barrier ☐ Intersection ☐ Safe Corridor
☐ Horizontal Curve ☐ Bicycle Safety ☐ Rural State Highways
Skid Hazard
☐ Roadway Departure
☐ Local Safety
☐ Left Turn Crash
☐ Other: Other-2 & 3 Ln Cross Centerline Collision Monitoring Pro

Yes

No

If yes, are local road projects identified using the same methodology as state roads?

Yes

No

If no, describe the methodology used to identify local road projects as part of this program.

HSIP application benefit-cost tool started with Cycle 4 “call for projects” in Fall 2010

How are highway safety improvement projects advanced for implementation?

Competitive application process
Select the processes used to prioritize projects for implementation. For the methods selected, indicate the relative importance of each process in project prioritization. Enter either the weights or numerical rankings. If weights are entered, the sum must equal 100. If ranks are entered, indicate ties by giving both processes the same rank and skip the next highest rank (as an example: 1, 2, 2, 4).

- Relative Weight in Scoring
- Rank of Priority Consideration

- Ranking based on B/C
- Available funding
- Incremental B/C
- Ranking based on net benefit
- Other
- Competitive application process

With respect to the subprogram for the Roadway Departure subprogram, two approaches are utilized to identify locations for investigation, namely the conventional approach and the systemic approach. In the conventional approach 7 criteria including F+I crashes per year per mile, F/(F+I), shoulder width, collisions in darkness, on wet pavement, and overturned vehicle collisions are used to develop a list of run-off-road collision concentrations. Top 25% of locations with high collision concentration from this list are selected for further field investigations. Additionally, a systematic approach is used involving deploying a relatively high number of low-cost countermeasures at longer segments of roadway selected based on crash history, roadway type, geometry, volume, benefit/cost using collision modification factors, etc.
Regarding 2 and 3 Lane Cross Centerline Collision Monitoring subprogram, the collisions considered for selection of locations for investigation are cross-centerline, head-on fatal collisions without left turn, and U-turn related collisions. Headquarters staff, use the statistics for fatality, fatality rate, and total collisions per mile to evaluate the locations meeting the selection criteria.

**What proportion of highway safety improvement program funds address systemic improvements?**

10

**Highway safety improvement program funds are used to address which of the following systemic improvements?**

- [ ] Cable Median Barriers
- [ ] Rumble Strips
- [ ] Traffic Control Device Rehabilitation
- [ ] Pavement/Shoulder Widening
- [ ] Install/Improve Signing
- [ ] Install/Improve Pavement Marking and/or Delineation
- [ ] Upgrade Guard Rails
- [ ] Clear Zone Improvements
- [ ] Safety Edge
- [ ] Install/Improve Lighting
- [ ] Add/Upgrade/Modify/Remove Traffic Signal
- [x] Other Other-Median Barrier (see optional description)

There is no set aside proportion of HSIP funds to addresses systemic improvements. Funding for median barrier projects varies annually depending on the number of projects proposed. Approximately 10 to 20% of the HSIP projects total cost are expended on median barrier projects.

**What process is used to identify potential countermeasures?**
Identify any program methodology practices used to implement the HSIP that have changed since the last reporting period.

☒ Highway Safety Manual
☐ Road Safety audits
☐ Systemic Approach
☒ Other: Other-New, increased collision costs are used to prioritize projects and develop cost/benefit analysis.

Describe any other aspects of the Highway Safety Improvement Program methodology on which you would like to elaborate.

1) Caltrans is currently undertaking a research project to develop safety performance functions for highways, intersections and ramps to be used in the Safety Analyst system which is consistent with the methodology in Highway Safety Manual (Type-I & Type-II performance functions). The goal is to replace the existing Traffic Accident Surveillance and Analysis System (TASAS) with Safety Analyst.

2) A comprehensive set of Performance Functions for various road types, intersections and ramps are being developed that will impact our identification of locations with high collision concentrations.
## Progress in Implementing Projects

<td>56.37%</td>
</tr>
</tbody>
</table>

How much funding is programmed to local (non-state owned and maintained) safety projects?

$98,389,649.00

How much funding is obligated to local safety projects?

$55,462,990.00
How much funding is programmed to non-infrastructure safety projects?

$35,208,515.00

How much funding is obligated to non-infrastructure safety projects?

$35,208,515.00

We have been able to provide the obligated funds for various categories listed in the table for question 17, but unable to specify the programming funds for the various categories except the HSIP (section 148) category. The obligated funds of $35,208,515 was for Section 164 repeat intoxicated transfer funds for alcohol impaired driving countermeasures. In order to be able to complete the question to satisfy the ORT functionality issue, we assumed the same value ($35,208,515) for programming.

How much funding was transferred in to the HSIP from other core program areas during the reporting period?

$0.00

How much funding was transferred out of the HSIP to other core program areas during the reporting period?

$0.00
Discuss impediments to obligating Highway Safety Improvement Program funds and plans to overcome this in the future.

The following are changes that were recently implemented (Local HSIP Cycle 7 application period, 4/7/15 – 7/31/15) to improve the selection, funding and timely delivery of quality safety projects.

- Increase the maximum Local HSIP funds per Agency and per project application to $10 million, so that complete projects can be funded by HSIP.
- Application of 23 USC, Section 120(c)(1) for 100% federal funding for Local HSIP projects, which includes low-cost, proven safety countermeasures that can be delivered in a timely manner.
- Require incremental approach, using lower cost and lower impact countermeasures (signing, striping upgrades, rumble strips) and evaluating their effectiveness on safety, before moving to higher cost and higher impact countermeasures (road widening, improving horizontal/vertical alignments and curve realignment projects).

For Local HSIP Cycle 6 projects, which are funded at 90% federal funds and minimum 10% local match, provide incentive for early project delivery using toll credits to cover 10% local match.

Also, a Systemic Safety Analysis Report (SSAR) Program has been developed, which will be made available to local agencies to provide a comprehensive systemic safety analysis of their roadways and intersections. The SSAR will assist local agencies in addressing safety issues on their roadway networks and help them prepare for future HSIP applications. The SSAR will focus on low-cost, proven safety countermeasures that can be delivered in a timely manner.

Describe any other aspects of the general Highway Safety Improvement Program implementation progress on which you would like to elaborate.

None

- # Fatalities
- # Serious Injuries
A set of 4 performance measures were calculated for California highways including the state and local roads. The performance measures were defined as 5 year rolling average of collision frequencies and collision rates for each of the five years, 2008 thru 2012. These performance measures are: 1) the number of fatalities, 2) the number of fatalities per 100 Million Vehicle Mile of Travel (MVMT), 3) the number of persons severely injured, and, 4) the number of persons severely injured per 100 MVMT. The data used to derive the rolling averages is from 2003 to 2012. The rolling averages show a decreasing trend, indicating improvement in road safety on California's state and local roads.
To the maximum extent possible, present performance measure* data by functional classification and ownership.

2008 2009 2010 2011 2012
1. The most recent calendar data available to us was for 2012.
2. The classification “Major Collector” in urban area in Caltrans data is specified as “Collector”.
3. Note that Caltrans currently does not compile collision data for severe injury as a separate category. However, the data is available for 3 levels of injuries (i.e., severe injury, visible injury, and complaint of pain) combined. Therefore, the input data in ORT columns for severe injury and severe injury rate are in fact for injury and injury rate.
4. For this Fiscal Year reporting period, we developed the travel data for road classifications listed in ORT. The travel data are specific to each of the road classifications and are for state highways (travel data on specific local roads not available).
5. The data input for the “State Highway Agency” in Part-2 (Roadway Ownership) of this question are for state and local roads.
Describe any other aspects of the general highway safety trends on which you would like to elaborate.

For this year reporting period, the most recent ten-year data was available for 2003 to 2012. During the 2012 calendar year, 1,049 fatal collisions, 47,426 injury collisions, and 90,182 property-damage-only (PDO) collisions were reported on the SHS. Caltrans estimates that these collisions resulted in losses of approximately $20.6 billion.

The HSIP and other State programs have made highways safer through the implementation of highway safety projects. This fact is evident from the fatality rate trends. Between 2003 and 2012, the fatality rate on all State highways has decreased 38 percent. For the same period, the fatality rate on freeways decreased 40 percent, and on non-freeways it decreased 32 percent. During the same period, the annual travel increased by 0.2 percent on all highways. The annual travel on freeways increased 1.8 percent, and on non-freeways it decreased by 6.8 percent. Freeway travel in 2012 accounts for 82.9 percent of travel on the SHS even though freeway road miles account for only 29 percent of the SHS.

The reductions in fatality rates have been accomplished by implementing safety projects. Many other improvements such as tree trimming, restriping, or installing warning signs that were requested by Traffic Operations staff and performed by Maintenance staff in the districts also contributed to improved safety. During FY 2014/15, there were 61 Major and Minor-A safety projects awarded at a cost of $100.85 million. All of these project types are consistent with one or more of the 17 challenge areas identified in California’s Strategic Highway Safety Plan (SHSP).

Application of Special Rules
Present the rate of traffic fatalities and serious injuries per capita for drivers and pedestrians over the age of 65.

<table>
<thead>
<tr>
<th>Older Driver Performance Measures</th>
<th>2009</th>
<th>2010</th>
<th>2011</th>
<th>2012</th>
<th>2013</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fatality rate (per capita)</td>
<td>5.132</td>
<td>4.894</td>
<td>4.71</td>
<td>4.836</td>
<td>4.826</td>
</tr>
<tr>
<td>Serious injury rate (per capita)</td>
<td>216.634</td>
<td>210.478</td>
<td>206.658</td>
<td>206.084</td>
<td>206.628</td>
</tr>
<tr>
<td>Fatality and serious injury rate (per capita)</td>
<td>221.766</td>
<td>215.37</td>
<td>211.366</td>
<td>210.918</td>
<td>211.45</td>
</tr>
</tbody>
</table>

*Performance measure data is presented using a five-year rolling average.*
Calculation:

1. **Calculate 5 year average F+I per capita for 2013**

   F+I collisions for Driver & Pedestrian (65 yr. and older) for 2009 to 2013 denoted as X9, X10, X11, X12, X13. Corresponding Population denoted as P9, P10, P11, P12, P13

2. F+I per capita 2009-2013 denoted as: X9/P9, X10/P10, X/11/P11, X12/P12, X13/P13

   Five Yr. Avg. F+I per capita for 2013 = (X9/P9+X10/P10+ X/11/P11+ X12/P12+X13/P13)/5 = (210.59+211.64+211.28+210.05+213.69)/5 =211.45

3. **Similarly, 5 Yr. Avg. F+I per capita for 2011 = (X7/P7+ X8/P8 + X9/P9+X10/P10+X11/P11)/5 = (211.28+210.05+213.69+207.93+213.88)/5 = 211.37

4. **Compare 2011 to 2013:** = (211.45-211.37)/211.37 = 0.0% *

*Per the Special Rule, all rates should be calculated to the hundredths after the decimal point and then rounded to the nearest tenths.
Rate of Fatalities and Serious injuries for the Last Five Years

1) The actual calculation is described in the main window for this question.

2) Please note that the data for severe injury in the table of performance measure was not available. We used the data for all injuries (severe + visible + complaint of pain) instead so the default plots produced by ORT do not show erroneous and confusing results.

Does the older driver special rule apply to your state?

No
Assessment of the Effectiveness of the Improvements (Program Evaluation)

What indicators of success can you use to demonstrate effectiveness and success in the Highway Safety Improvement Program?

- None
- Benefit/cost
- Policy change
- Other: Other-Benefit cost derived based on changes in the number of fatal, injury and PDO collisions

What significant programmatic changes have occurred since the last reporting period?

- Shift Focus to Fatalities and Serious Injuries
- Include Local Roads in Highway Safety Improvement Program
- Organizational Changes
- None
- Other:

Briefly describe significant program changes that have occurred since the last reporting period.

The safety work related to the Strategic Highway Safety Plan (SHSP) & HSIP are now under the same office.
**SHSP Emphasis Areas**

ORT does not have the capability to plot the data for performance measure added by the users. ORT plots data only for default PMs that are defined originally in ORT. Work Zone was an ORT defined PM and the data for this challenge area was plotted. The remaining challenge areas are user's defined and specific to Caltrans and therefore not plotted.

The data for challenge areas were retrieved from SafeTREC, UC Berkeley. For this year HSIP report, the fatalities and severe injuries were available by victim counts as opposed to collision counts. In developing the performance measure, we revised the analysis for this report to develop the 5 year rolling averages based victim counts of fatalities and severe injuries.

Target Crash Type

Number of Serious Injuries
1. Local Road Program is specified as a subprogram due to ORT functionality limitations. We specified it as a subprogram so Caltrans Division of Local Assistance can report on their program. The performance measures values for only this subprogram are fictitious values so that ORT allows us to show the local roads as a subprogram. The progress for the local road program is reported in a separate attachment to question 23.

2. The data provided in the table of performance measures for the 5 subprograms are not plotted. This is due to ORT limitations where, only the performance measures that are defined by ORT are plotted.
3. Also, note that Caltrans currently does not compile collision data for *severe* injury as a separate category. However, the data is available for 3 levels of injuries (i.e., severe injury, visible injury, and complaint of pain) combined. Therefore, the performance measures were developed for injury as a whole. The values shown for severe injury columns in this question represent the 3 levels of injuries combined.

Caltrans currently does not compile collision data for severe injury as a separate category. However, the data is available for 3 levels of injuries (i.e., severe injury, visible injury, and complaint of pain) combined. Therefore, the performance measures were developed for injury as a whole. The values shown for severe injury columns in this question represent the 3 levels of injuries combined.
Describe any other aspects of the overall Highway Safety Improvement Program effectiveness on which you would like to elaborate.

The most recent annual collision data available was for 2012. Caltrans implements the HSIP for State highways by programming and funding projects in the Collision Reduction Category, one of eight categories that make up the State Highway Operation and Protection Program (SHOPP). The Collision Reduction Category is further divided into two programs: Safety Improvement, and Collision Severity Reduction. The Safety Improvement Program is among Caltrans’ top priorities in the SHOPP and as a result, all projects that meet the criteria for the Safety Improvement Program are funded. These criteria include a benefit-cost analysis. The projects evaluated in this report include all projects funded by the Collision Reduction Category, which includes both federal HSIP and State highway funds.

Caltrans uses the Transportation System Network database to identify locations with significantly high collision concentrations. The identified locations are systematically investigated to determine probable causes of the collisions in order to implement effective countermeasures to improve safety. Other locations identified for investigation and possible implementation of countermeasures are generated from three Monitoring Programs: Cross Median Collision, Two and Three Lane Cross Centerline Collision, and Wrong Way Collision. Nearly 2,468 traffic safety investigations were processed between 01-01-2014 and 12-31-2014. In addition, 528 “Other Safety” investigations were processed. These safety related investigations, were not generated by TASAS but by citizens' calls, letters, emails, etc. Finally, as of February, 2012, Caltrans has implemented a 5-year “California Roadway Departure Safety Implementation Plan” which identified over 7,000 locations for possible low cost countermeasures to systematically implement on many state highways in an effort to reduce roadway departure crashes.

The reductions in fatality rates have been accomplished by implementing safety projects. Many other improvements such as tree trimming, restriping, or installing warning signs that were requested by Traffic Operations staff and performed by Maintenance staff in the districts also contributed to improved safety. During FY 2014/15, there were 61 Major and Minor-A safety projects awarded at a cost of $100.85 million. All of these project types are consistent with one or more of the 17 challenge areas identified in California’s Strategic Highway Safety Plan (SHSP).

The effectiveness of the State HSIP was measured by comparing collision data before and after safety improvements were implemented at project sites. These projects have been completed between 7/1/2010 and 6/30/2011. Three years of collision data before project implementation was compared with three years of collision data after project implementation. A total of 78 projects were considered in the evaluation. Analysis of collision data was based on 110 highway locations as some of the projects contained more than one highway location. The cost of
implementing these projects was $119.4 million. The annual savings, in terms of reductions in collision frequency and severity, was estimated at $78.3 million. This translates to a savings of $1565.2 million or a benefit-cost ratio of 13.1 to 1, assuming a project life of 20 years.
## Project Evaluation

Provide project evaluation data for completed projects (optional).

Glossary

5 year rolling average means the average of five individual, consecutive annual points of data (e.g. annual fatality rate).

Emphasis area means a highway safety priority in a State’s SHSP, identified through a data-driven, collaborative process.

Highway safety improvement project means strategies, activities and projects on a public road that are consistent with a State strategic highway safety plan and corrects or improves a hazardous road location or feature or addresses a highway safety problem.

HMVMT means hundred million vehicle miles traveled.

Non-infrastructure projects are projects that do not result in construction. Examples of non-infrastructure projects include road safety audits, transportation safety planning activities, improvements in the collection and analysis of data, education and outreach, and enforcement activities.

Older driver special rule applies if traffic fatalities and serious injuries per capita for drivers and pedestrians over the age of 65 in a State increases during the most recent 2-year period for which data are available, as defined in the Older Driver and Pedestrian Special Rule Interim Guidance dated February 13, 2013.

Performance measure means indicators that enable decision-makers and other stakeholders to monitor changes in system condition and performance against established visions, goals, and objectives.

Programmed funds mean those funds that have been programmed in the Statewide Transportation Improvement Program (STIP) to be expended on highway safety improvement projects.

Roadway Functional Classification means the process by which streets and highways are grouped into classes, or systems, according to the character of service they are intended to provide.

Strategic Highway Safety Plan (SHSP) means a comprehensive, multi-disciplinary plan, based on safety data developed by a State Department of Transportation in accordance with 23 U.S.C. 148.

Systemic safety improvement means an improvement that is widely implemented based on high risk roadway features that are correlated with specific severe crash types.

Transfer means, in accordance with provisions of 23 U.S.C. 126, a State may transfer from an apportionment under section 104(b) not to exceed 50 percent of the amount apportioned for the fiscal year to any other apportionment of the State under that section.
