While these safety messages and tips are integral to improving overall railroad safety, hinged pedestrian gate skirts are physical structures that can help further improve pedestrian safety at rail crossings. A hinged pedestrian gate skirt is a secondary horizontal bar that hangs under an existing pedestrian gate. This treatment deters pedestrians from going under a gate that is in movement and in the down position. The low position of the gate skirt also benefits people who are blind or have low vision because the gate can be detected using canes or other mobility aids. Both Connecticut and New Jersey have installed hinged pedestrian gate skirts to better block access to crossings, deterring pedestrian violations.

Connecticut

When new roadway construction and land use changes occurred in New Britain, Connecticut, the Connecticut Department of Transportation (CTDOT) converted an existing highway-railroad crossing to a pedestrian- and bicycle-only crossing. The new railroad crossing design needed to safely accommodate pedestrians and bicyclists accessing a nearby busway station, multi-use trail, and other amenities. CTDOT and its railroad partners worked together to develop the new crossing design, which featured a hinged pedestrian gate skirt. Fencing, emergency exit gates, and video monitoring were also included in the design to optimize safety. The project was completed in June 2016.

As the first State to install a hinged pedestrian gate skirt, Connecticut has found the crossing treatment an effective safety tool. CTDOT intends to install a similar hinged gate skirt system in the Branchville section of Ridgefield, Connecticut, at a Metro-North Railroad crossing where vehicle access will be modified to pedestrian/bicyclist-only access.²

New Jersey

In 2016, three pedestrians were hit and killed near the Main Street and Ramsey transit station in Ramsey, New Jersey. The New Jersey Department of Transportation (NJDOT), New Jersey Transit, Federal Railroad Administration (FRA), and local town officials worked together to find and implement a treatment to help prevent similar tragedies from occurring again. The team determined that installing a hinged pedestrian gate skirt was an effective solution for the crossing.

In the summer of 2017, NJDOT became the second State in the country to install a hinged pedestrian gate skirt. As part of the project, NJDOT also added fencing, signs, and pavement markings to increase safety and improve general awareness near the crossing. According to NJDOT, the number of violations have decreased at the location, and most importantly, no fatalities have occurred since the installation of the hinged pedestrian gate skirt.³
