May 26, 2020

Mr. Ahmad Hammad
WSP USA Inc.
2200 Western Court, Suite 120
Lisle, IL 60532
USA

Dear Mr. Hammad:

This letter is in response to your January 29, 2020 request for the Federal Highway Administration (FHWA) to review a roadside safety device, hardware, or system for eligibility for reimbursement under the Federal-aid highway program. This FHWA letter of eligibility is assigned FHWA control number B-338 and is valid until a subsequent letter is issued by FHWA that expressly references this device.

**Decision**

The following device is eligible within the length-of-need, with details provided in the form which is attached as an integral part of this letter:

- Constant Slope Barrier on Cantilevered Bridge Deck with Noise Abatement Wall Panels

**Scope of this Letter**

To be found eligible for Federal-aid funding, new roadside safety devices should meet the crash test and evaluation criteria contained in the American Association of State Highway and Transportation Officials’ (AASHTO) Manual for Assessing Safety Hardware (MASH). However, the FHWA, the Department of Transportation, and the United States Government do not regulate the manufacture of roadside safety devices. Eligibility for reimbursement under the Federal-aid highway program does not establish approval, certification or endorsement of the device for any particular purpose or use.

This letter is not a determination by the FHWA, the Department of Transportation, or the United States Government that a vehicle crash involving the device will result in any particular outcome, nor is it a guarantee of the in-service performance of this device. Proper manufacturing, installation, and maintenance are required in order for this device to function as tested.

This finding of eligibility is limited to the crashworthiness of the system and does not cover other structural features, nor conformity with the Manual on Uniform Traffic Control Devices.
Eligibility for Reimbursement

Based solely on a review of crash test results and certifications submitted by the manufacturer, and the crash test laboratory, FHWA agrees that the device described herein meets the crash test and evaluation criteria of the AASHTO’s MASH. Therefore, the device is eligible for reimbursement under the Federal-aid highway program if installed under the range of tested conditions.

Name of system: Constant Slope Barrier on Cantilevered Bridge Deck with Noise Abatement Wall Panels
Type of system: Bridge Barrier
Test Level: MASH Test Level 5 (TL5)
Testing conducted by: Texas A&M Transportation Institute
Date of request: January 29, 2020

FHWA concurs with the recommendation of the accredited crash testing laboratory on the attached form.

Full Description of the Eligible Device

The device and supporting documentation, including reports of the crash tests or other testing done, videos of any crash testing, and/or drawings of the device, are described in the attached form.

Notice

This eligibility letter is issued for the subject device as tested. Modifications made to the device are not covered by this letter. Any modifications to this device should be submitted to the user (i.e., state DOT) as per their requirements.

You are expected to supply potential users with sufficient information on design, installation and maintenance requirements to ensure proper performance.

You are expected to certify to potential users that the hardware furnished has the same chemistry, mechanical properties, and geometry as that submitted for review, and that it will meet the test and evaluation criteria of AASHTO’s MASH.

Issuance of this letter does not convey property rights of any sort or any exclusive privilege. This letter is based on the premise that information and reports submitted by you are accurate and correct. We reserve the right to modify or revoke this letter if: (1) there are any inaccuracies in the information submitted in support of your request for this letter, (2) the qualification testing was flawed, (3) in-service performance or other information reveals safety problems, (4) the system is significantly different from the version that was crash tested, or (5) any other information indicates that the letter was issued in error or otherwise does not reflect full and complete information about the crashworthiness of the system.
**Standard Provisions**

- To prevent misunderstanding by others, this letter of eligibility designated as FHWA control number B-338 shall not be reproduced except in full. This letter and the test documentation upon which it is based are public information. All such letters and documentation may be reviewed upon request.

- This letter shall not be construed as authorization or consent by the FHWA to use, manufacture, or sell any patented system for which the applicant is not the patent holder.

- This FHWA eligibility letter is not an expression of any Agency view, position, or determination of validity, scope, or ownership of any intellectual property rights to a specific device or design. Further, this letter does not impute any distribution or licensing rights to the requester. This FHWA eligibility letter determination is made based solely on the crash-testing information submitted by the requester. The FHWA reserves the right to review and revoke an earlier eligibility determination after receipt of subsequent information related to crash testing.

Sincerely,

Michael S. Griffith  
Director, Office of Safety Technologies  
Office of Safety

Enter below all disclosures of financial interests as required by the FHWA `Federal-Aid Reimbursement Eligibility Process for Safety Hardware Devices' document.

Texas A&M Transportation Institute (TTI) was contracted by WSP USA Inc. (WSP) to perform full-scale crash testing of the 6-ft Tall Illinois Tollway Constant Slope Barrier on Cantilevered Bridge Deck with Noise Abatement Wall Panels. There are no shared financial interests in the 6-ft Tall Illinois Tollway Constant Slope Barrier on Cantilevered Bridge Deck with Noise Abatement Wall Panels by TTI, or between WSP and TTI, other than costs involved in the actual crash tests and reports for this submission to FHWA. **690900-ITG4-6**
PRODUCT DESCRIPTION

The installation was 90 ft-½-inch long, and consisted of a 6-ft tall, combination constant slope (44 inches tall) and vertical face (28 inches tall), reinforced concrete barrier anchored to a cantilevered reinforced concrete deck. A ½-inch joint in the deck and barrier was located 30 ft from the upstream end of the installation. W8×48 posts were secured to the back of the barrier, spaced at 11 ft-8 inches on center. These posts supported noise abatement wall panels that extended to 18 ft above grade.

CRASH TESTING

By signature below, the Engineer affiliated with the testing laboratory, agrees in support of this submission that all of the critical and relevant crash tests for this device listed above were conducted to meet the MASH test criteria. The Engineer has determined that no other crash tests are necessary to determine the device meets the MASH criteria.

<tr>
<td>5-10 (1100C)</td>
<td>Test 5-10 involves an 1100C vehicle impacting the test article at a target impact speed of 62 mi/h ±2.5 mi/h and a target impact angle of 25° ±1.5°. The target CIP was determined using the information provided in MASH Section 2.2.1, Section 2.3.2, and Table 2-7 and was for the left corner of the front bumper to impact at 3.6 ft upstream of the barrier joint. The results of the test conducted on September 18, 2019, are found in TTITest Report number 690900-ITG4-6. The test vehicle was traveling at an impact speed of 60.6 mi/h as it made contact with the barrier 3.8 ft upstream of the barrier joint at an impact angle of 26.3°. After loss of contact with the barrier, the vehicle came to rest 160 ft downstream of the impact point and 15 ft towards the traffic side. The barrier contained and redirected the 1100C vehicle. The vehicle did not penetrate, underride, or override the installation. The 1100C vehicle exited within the exit box criteria. Working width was 37-1/2 inches to the field side of post support protrusions. There was no measurable dynamic deflection during the test, or permanent deformation observed afterwards, for either the barrier or the wall. No detached elements, fragments, or other debris were present to penetrate or show potential for penetrating the occupant compartment, or present hazard to others in the area. Maximum exterior crush to the vehicle was 8.0 inches in the front plane at the left front corner at bumper height. Maximum occupant compartment deformation was 3.0 inch in the left floor pan and firewall area. The 1100C vehicle remained upright during and after the collision event. Maximum roll and pitch angles were 20° and 9°, respectively. Longitudinal OIV was 22.6 ft/s, and lateral OIV was 31.2 ft/s. Longitudinal occupant ridedown acceleration was 2.9 g, and lateral occupant ridedown acceleration 10.6 g. The occupant risk factors were within the MASH preferred limits.</td>

<td>5-11 (2270P)</td>
<td>Test 5-11 involves a 2270P vehicle impacting the test article at a target impact speed of 62 mi/h ±2.5 mi/h and a target impact angle of 25° ±1.5°. The target CIP was determined using the information provided in MASH Section 2.2.1, Section 2.3.2, and Table 2-7 and was for the left corner of the front bumper to impact at 4.3 ft upstream of the barrier joint. The results of the test conducted on September 19, 2019 are found in TTI Test Report number 690900-ITG4-6. The test vehicle was traveling at an impact speed of 63.2 mi/h as it made contact with the barrier 4.9 ft upstream of the barrier joint at an angle of 26.4°. After loss of contact with the barrier, the vehicle came to rest 209 ft downstream of the impact point and 60 ft towards the traffic side. The barrier contained and redirected the 2270P vehicle. The vehicle did not penetrate, underride, or override the installation. The 2270P vehicle exited within the exit box criteria. Working width was 37 1/2-inches to the field side of post support protrusions. There was no measurable dynamic deflection during the test, or permanent deformation observed afterwards, for either the barrier or the wall. No detached elements, fragments, or other debris were present to penetrate or show potential for penetrating the occupant compartment, or present hazard to others in the area. Maximum exterior crush to the vehicle was 14.0 inches in the front plane at the left front corner at bumper height. Maximum occupant compartment deformation was 3.0 inches in the left front firewall and kick panel area. The 2270P vehicle remained upright during and after the collision event. Maximum roll and pitch angles were 23° and 3°, respectively. Longitudinal OIV was 17.7 ft/s, and lateral OIV was 30.5 ft/s. Longitudinal occupant ridedown acceleration was 7.3 g, and lateral occupant ridedown acceleration 14.3 g. The occupant risk factors were within the MASH preferred limits.</td>
<td>PASS</td>
</tr>
</tbody>
</table>

The 6-ft tall Illinois Tollway Constant Slope Barrier with Noise Abatement Wall Panels performed acceptably for MASH test 5-11.
Test 5-12 involves a 36000V vehicle impacting the test article at a target impact speed of 50 mi/h ±2.5 mi/h and a target impact angle of 15° ±1.5°. The target CIP was determined using the information provided in MASH Section 2.2.1, Section 2.3.2, and Table 2-7 and to impact at 1 ft downstream of the barrier joint.

The results of the test conducted on September 25, 2019 are found in TTI Test Report number 690900-ITG4-6. The test vehicle was traveling at an impact speed of 50.3 mi/h as it made contact with the barrier 0.9 ft downstream of the barrier joint at an angle of 14.6°. After loss of contact with the barrier, the vehicle came to rest 240 ft downstream of the impact point and 90 ft towards the field side.

The barrier contained and redirected the 36000V vehicle. The vehicle did not penetrate, underride, or override the installation. The 36000V vehicle exited within the exit box criteria.

Working width was 39.6 inches to the field side of post support protrusions. During the test the maximum dynamic deflection was 2.1 inches at the top of the noise abatement wall panel. The maximum permanent deformation was 0.5 inch at the top of the barrier just downstream of the joint.

No detached elements, fragments, or other debris were present to penetrate or show potential for penetrating the occupant compartment, or present hazard to others in the area.

Maximum exterior crush to the vehicle was 14.0 inches in the front plane at the left front corner at bumper height. Maximum occupant compartment deformation was 0.5 inch at the left side floor pan.

The 36000V vehicle remained upright during and after the collision event. Maximum roll was 6°. Longitudinal OIV was 2.6 ft/s, and lateral OIV was 11.8 ft/s. Longitudinal occupant riddenown acceleration was 5.9 g, and lateral occupant riddenown acceleration 12.6 g. The occupant risk factors were within the MASH preferred limits.

The 6-ft tall Illinois Tollway Constant Slope Barrier with Noise Abatement Wall Panels performed acceptably for MASH test 5-12.

ATTACHMENTS

Attach to this form:
1) Additional disclosures of related financial interest as indicated above.
2) A copy of the full test report, video, and a Test Data Summary Sheet for each test conducted in support of this request.
3) A drawing or drawings of the device(s) that conform to the Task Force-13 Drawing Specifications [Hardware Guide Drawing Standards]. For proprietary products, a single isometric line drawing is usually acceptable to illustrate the product, with detailed specifications, intended use, and contact information provided on the reverse. Additional drawings (not in TF-13 format) showing details that are relevant to understanding the dimensions and performance of the device should also be submitted to facilitate our review.
