Mr. John M. Pappas  
Flex-0-Lite  
Services and Materials Co.  
2997 Clarkson Road  
Chesterfield, MO 63017

Dear Mr. Pappas:

Thank you for your letter of December 28, 1999, requesting Federal Highway Administration (FHWA) acceptance of your company’s drums, barricades, and portable sign stands as crashworthy traffic control devices for use in work zones on the National Highway System (NHS). These devices were previously tested by Dicke Tool Company and are acceptable under FHWA Acceptance Letter WZ-17 dated July 20, 1999. Accompanying your letter was a report from the Midwest Roadside Safety Facility (MWRSF) and a detailed description and drawing of each device. You requested that we issue a separate letter to you indicating that the devices are acceptable for use on the NHS under the provisions of National Cooperative Highway Research Program (NCHRP) Report 350 ‘Recommended Procedures for the Safety Performance Evaluation of Highway Features.”

The FHWA guidance on crash testing of work zone traffic control devices is contained in two memoranda. The first, dated July 25, 1997, titled ‘Information: Identifying Acceptable Highway Safety Features,” established four categories of work zone devices: Category I devices were those lightweight devices which could be self-certified by the vendor, Category II devices were other lightweight devices which needed individual crash testing, Category III devices were barriers and other fixed or massive devices also needing crash testing, and Category IV devices were trailer mounted lighted signs, arrow panels, etc. The second guidance memorandum was issued on August 28, 1998, and is titled “INFORMATION: Crash Tested Work Zone Traffic Control Devices.” This later memorandum lists devices that are acceptable under Categories I, II, and III.

The following devices were tested with successful results and are detailed in Enclosure 1. A drawing of each appears in Enclosure 2. A summary of the crash tests appears in Enclosure 3.

(Systems 1 and 2) A 626 mm wide x 984 mm tall Type I plastic barricade with a NightFlasher warning light mounted at the top. Your model number PRB-124

(System 3) A 318 mm wide x 1035 mm tall Type I plastic barricade with a NightFlasher mounted at the top. Your model number VPB-44

(System 4) A low density polyethylene 1500 series drum with a NightFlasher warning light mounted at the top.
Your model number QLV-W. A rigid mounted portable sign support with a 1219 mm square vinyl sign mounted at a height of 356 mm and three wood-staffed flags mounted at 2076 mm

Model number QFV60. A heavy-duty extension, spring mounted sign support with a 1219 mm square vinyl sign mounted at 1476 mm with three wood-staffed flags mounted at 3 194 mm

Your model number QFV-W. A double-torsion, spring mounted sign support with a 1218 mm square vinyl sign at 356 mm and three wood-staffed flags at 2070 mm

Model number QFV48. A heavy-duty extension, spring mounted sign support with a 1219 mm square vinyl sign at 324 mm and three wood-staffed flags at 2038 mm.

The test articles did not show potential for penetrating the occupant compartment. The results of the MWRSF testing met the FHWA requirements and, therefore, the devices listed in Enclosure 1 are acceptable for use as Test Level 3 devices on the NHS under the range of conditions tested, when proposed by a State.

Please note the following standard provisions which apply to FHWA letters of acceptance:

- Our acceptance is limited to the crashworthiness characteristics of the devices and does not cover their structural features, nor conformity with the Manual on Uniform Traffic Control Devices.

- Any changes that may adversely influence the crashworthiness of the device will require a new acceptance letter.

- Should the FHWA discover that the qualification testing was flawed, that in-service performance reveals unacceptable safety problems, or that the device being marketed is significantly different from the version that was crash tested, it reserves the right to modify or revoke its acceptance.

- You will be expected to supply potential users with sufficient information on design and installation requirements to ensure proper performance.

- You will be expected to certify to potential users that the hardware furnished has essentially the same chemistry, mechanical properties, and geometry as that submitted for acceptance, and that they will meet the crashworthiness requirements of FHWA and NCHRP Report 350. A quality assurance program, developed to suit your needs, is necessary to do this.

- To prevent misunderstanding by others, this letter of acceptance, designated as number WZ-38 shall not be reproduced except in full.
Some of your traffic control devices are patented products and considered “proprietary.”

Use of proprietary work zone traffic control devices in Federal-aid projects is generally of a temporary nature. They are selected by the contractor for use as needed and removed upon completion of the project.

“a” given below for the use of proprietary products on Federal-aid projects, if proprietary devices are specified for use on Federal-aid projects, except exempt projects, they:

(a) must be supplied through competitive bidding with equally suitable unpatented items;

(b) the highway agency must certify that they are essential for synchronization with existing highway facilities or that no equally suitable alternative exists;

(c) they must be used for research or for a distinctive type of construction on relatively short sections of road for experimental purposes.

Our regulations concerning proprietary products are contained in Title 23, Code of Federal...

NOTES to Enclosure 1. Please refer to the individual drawings for the details of each device.

DEVICE: LDPE: Low Density Polyethylene. Stand: X-footprint portable sign stand holding roll-up sign.

LEGES: All legs are of square tubular aluminum. Rigid legs are 31.75 mm square. Telescoping legs are 31.75 mm and 25.45 mm square.

BASE: “Rigid Steel” are 4.76 mm flanges with a 38.1mm steel tube 633 mm or less in height.
“Extension Spring” are steel with a heavy duty extension spring system.
“Double Spring” are steel with a double torsion spring system.

MAST: “Alum., full height” are square tubular aluminum supports of one to three components, sizes vary. Mast extends from the base to the top of the sign panel.
“Alum., extra height” is a square tubular aluminum support of three components. The mast extends above the top of the sign panel to support flags.
“Alum., half height” is a square tubular aluminum support of two components. The mast extends to the center of the sign panel.
“Fiberglass” is a flexible fiberglass piece approx. 31 mm wide, of thickness as noted. It attaches to a square steel tube upright 460 mm or shorter.

HEIGHT: This is the height from the ground to the top of the sign panel. In system # 12 the flags are elevated 331 mm above the sign. In all others the flag support is at the top of the sign.

FLAGS: Material of flagstaff: Wood = 610 mm long, 19 mm diameter wood rod. Fiber. = 559 mm long fiberglass.
(Light) = No flags present, but light mounted on top of barricade or drum. Tested lights were “Service and Materials NightFlasher Light. Mass with batteries 1.77 kg. Light attached to top of drum with standard vandal-resistant hardware with “cupped” washer.
