May 13, 2020

Mr. John Pasakarnis  
Dicke Safety Products  
1201 Waren Ave.  
Downers Grove, IL 60515

Dear Mr. Pasakarnis:

This letter is in response to your August 2, 2019 request for the Federal Highway Administration (FHWA) to review a roadside safety device, hardware, or system for eligibility for reimbursement under the Federal-aid highway program. This FHWA letter of eligibility is assigned FHWA control number WZ-390 and is valid until a subsequent letter is issued by FHWA that expressly references this device.

Decision

The following device is eligible within the length-of-need, with details provided in the form which is attached as an integral part of this letter:

- Dicke Safety Products TF18-RUB Traffic Control Sign

Scope of this Letter

To be found eligible for Federal-aid funding, new roadside safety devices should meet the crash test and evaluation criteria contained in the American Association of State Highway and Transportation Officials’ (AASHTO) Manual for Assessing Safety Hardware (MASH). However, the FHWA, the Department of Transportation, and the United States Government do not regulate the manufacture of roadside safety devices. Eligibility for reimbursement under the Federal-aid highway program does not establish approval, certification or endorsement of the device for any particular purpose or use.

This letter is not a determination by the FHWA, the Department of Transportation, or the United States Government that a vehicle crash involving the device will result in any particular outcome, nor is it a guarantee of the in-service performance of this device. Proper manufacturing, installation, and maintenance are required in order for this device to function as tested.

This finding of eligibility is limited to the crashworthiness of the system and does not cover other structural features, nor conformity with the Manual on Uniform Traffic Control Devices.
Eligibility for Reimbursement

Based solely on a review of crash test results and certifications submitted by the manufacturer, and the crash test laboratory, FHWA agrees that the device described herein meets the crash test and evaluation criteria of the AASHTO’s MASH. Therefore, the device is eligible for reimbursement under the Federal-aid highway program if installed under the range of tested conditions.

Name of system: Dicke Safety Products TF18-RUB Traffic Control Sign
Type of system: Work Zone
Test Level: MASH Test Level 3 (TL3)
Testing conducted by: Texas A&M Transportation Institute
Date of request: August 2, 2019

FHWA concurs with the recommendation of the accredited crash testing laboratory on the attached form.

Full Description of the Eligible Device

The device and supporting documentation, including reports of the crash tests or other testing done, videos of any crash testing, and/or drawings of the device, are described in the attached form.

Notice

This eligibility letter is issued for the subject device as tested. Modifications made to the device are not covered by this letter. Any modifications to this device should be submitted to the user (i.e., state DOT) as per their requirements.

You are expected to supply potential users with sufficient information on design, installation and maintenance requirements to ensure proper performance.

You are expected to certify to potential users that the hardware furnished has the same chemistry, mechanical properties, and geometry as that submitted for review, and that it will meet the test and evaluation criteria of AASHTO’s MASH.

Issuance of this letter does not convey property rights of any sort or any exclusive privilege. This letter is based on the premise that information and reports submitted by you are accurate and correct. We reserve the right to modify or revoke this letter if: (1) there are any inaccuracies in the information submitted in support of your request for this letter, (2) the qualification testing was flawed, (3) in-service performance or other information reveals safety problems, (4) the system is significantly different from the version that was crash tested, or (5) any other information indicates that the letter was issued in error or otherwise does not reflect full and complete information about the crashworthiness of the system.
Standard Provisions

- To prevent misunderstanding by others, this letter of eligibility designated as FHWA control number WZ-390 shall not be reproduced except in full. This letter and the test documentation upon which it is based are public information. All such letters and documentation may be reviewed upon request.

- This letter shall not be construed as authorization or consent by the FHWA to use, manufacture, or sell any patented system for which the applicant is not the patent holder.

- This FHWA eligibility letter is not an expression of any Agency view, position, or determination of validity, scope, or ownership of any intellectual property rights to a specific device or design. Further, this letter does not impute any distribution or licensing rights to the requester. This FHWA eligibility letter determination is made based solely on the crash-testing information submitted by the requester. The FHWA reserves the right to review and revoke an earlier eligibility determination after receipt of subsequent information related to crash testing.

Sincerely,

Michael S. Griffith
Director, Office of Safety Technologies
Office of Safety

Enclosures
Request for Federal Aid Reimbursement Eligibility of Highway Safety Hardware

| Submitter | Date of Request: | 08/02/2019 | Name: DickeSafetyProducts, c/o John M. Pasakarnis | Company: DickeSafetyProducts | Address: 1201 Warren Avenue, Downers Grove, IL 60515 | Country: USA | To: Michael S. Griffith, Director FHWA, Office of Safety Technologies |

I request the following devices be considered eligible for reimbursement under the Federal-aid highway program.

**Device & Testing Criterion** - Enter from right to left starting with Test Level

Enter below all disclosures of financial interests as required by the FHWA ‘Federal-Aid Reimbursement Eligibility Process for Safety Hardware Devices’ document.

Texas A&M Transportation Institute (TTI) was contracted by Dicke Safety Products to perform full-scale crash testing of the TF18-RUB Traffic Control Sign Stand. There are no shared financial interests in the TF18-RUB Traffic Control Sign Stand by TTI, or between Dicke Safety Products and TTI, other than costs involved in the actual crash tests and reports for this submission to FHWA.
PRODUCT DESCRIPTION

The tested traffic control device was a proprietary traffic control sign stand manufactured by Dicke Safety Products of Downers Grove, Illinois. Each test assembly consisted of a base, telescoping aluminum uprights, a sign assembly, and three flags. The base was comprised of four tubular legs, springs, and brackets. The sign assembly (Model Name: RUNR48-200) consisted of a non-reflective vinyl banner with reinforced corners and fiberglass stiffeners. The bottom corner of the sign was positioned 22 inches above grade.

CRASH TESTING

By signature below, the Engineer affiliated with the testing laboratory, agrees in support of this submission that all of the critical and relevant crash tests for this device listed above were conducted to meet the MASH test criteria. The Engineer has determined that no other crash tests are necessary to determine the device meets the MASH criteria.

Engineer Name: Roger Bligh
Engineer Signature: [Digitally signed by Roger Bligh]
Address: 3100 SH47, Building 7091, Bryan, Texas 77807

A brief description of each crash test and its result:

<table>
<thead>
<tr>
<th>Required Test Number</th>
<th>Narrative Description</th>
<th>Evaluation Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-70(1100C)</td>
<td>MASH states that Test 3-70 for small vehicles is considered optional for work-zone traffic control devices weighing less than 220 lb, because velocity changes during low-speed impacts with free-standing, lightweight features will be within acceptable limits. The traffic control device weighed approximately 43 pounds. Therefore, MASH Test 3-70 was not performed on this traffic control device.</td>
<td>Non-Critical, not conducted</td>
</tr>
</tbody>
</table>
MASH Test 3-71 involves an 1100C vehicle weighing 2420 lb ±55 lb impacting the traffic control device at an impact speed of 62 mi/h ±2.5 mi/h. Per MASH recommendations, the device was tested at critical impact angles (CIAs) of 90° ±1.5° and 0° ±1.5°. The results of test 690900-DSP3 conducted on November 20, 2018 are found in TTITestReport number 690900-DSP3-4-4a. The test vehicle was traveling at 62.6 mi/h when it contacted the first traffic control device at an impact angle of 90°, and was traveling at 61.5 mi/h when it contacted the second device at an impact angle of 0°. The vehicle came to rest 320 ft downstream of the impact and 8 ft to the right of centerline of the vehicle path. Both assemblies fractured into several pieces with the debris field measuring 15 ft left and 16 ft downstream of the first impact. There were scuff marks on the front bumper, hood, and windshield. The windshield was cracked, but there was no tear or hole. No measurable exterior crush to the vehicle was noted, and no occupant compartment deformation or intrusion was noted. MASH does not require instrumentation of the vehicle for tests of traffic control devices weighing less than 220 lb, thus, the occupant risk factors were not calculated for this test. The evaluation of the second impact was not hindered by the first impact. The device performed acceptably for MASH test 3-71.

The evaluation of the second impact was not hindered by the first impact. The device performed acceptably for MASH test 3-71.</td>
<td>PASS</td>
</tr>
</tbody>
</table>
MASH Test 3-72 involves a 2270P vehicle weighing 5000 lb ±110 lb impacting the traffic control device at an impact speed of 62 mi/h ±2.5 mi/h. Per MASH recommendations, the device was tested at critical impact angles (CIAs) of 90° ±1.5° and 0° ±1.5°. The results of test 690900-DSP4 conducted on November 20, 2018 are found in TTITestReport number 690900-DSP3-4-4a. The test vehicle was traveling at an impact speed of 62.7 mi/h when it contacted the first traffic control device at an impact angle of 90°. After impacting the first device, the pickup truck’s trajectory slightly shifted, which caused the impact with the second device to be of a glancing nature, instead of fully engaging the device. This hindered evaluation of impact performance of the second device. Therefore, a separate test (Test No. 690900-DSP4A) was conducted to evaluate the impact performance of the device at 0°. Test 690900-DSP4A is described below. In test 690900-DSP4, the vehicle came to rest 355 ft downstream of the impact and in the centerline of the vehicle path. The test assemblies fractured into several pieces with the debris field measuring 18 ft right and 260 ft downstream of the first impact. The front bumper and hood sustained scuff marks and two small dents. There was a 2-inch long × 0.75 inch wide tear on the right front edge of the hood, and another 2.25-inch long × 1.25-inch wide tear in the right rear of the hood. The windshield was cracked, but there was no tear or hole. No measurable exterior crush to the vehicle was noted (other than the above mentioned hood damage), and no occupant compartment deformation or intrusion was noted. MASH does not require instrumentation of the vehicle for tests of traffic control devices weighing less than 220 lb, thus, the occupant risk factors were not calculated for this test. The device performed acceptably for MASH test 3-72 with an impact angle of 90°. The results of test 690900-DSP4A conducted on November 21, 2018 are found in TTITestReport number 690900-DSP3-4-4a. The test vehicle was traveling at an impact speed of 63.5 mi/h when it contacted the traffic control device at an impact angle of 0°. The vehicle came to rest 327 ft downstream of the impact and 10 ft to the left of the centerline of the vehicle path. The assembly fractured into several pieces with the debris field measuring 17 ft left and 155 ft downstream of the impact point. The front bumper and hood sustained scuff marks and two small dents. There was a 2.3-inch long × 0.9-inch wide tear on the right front edge of the hood, and another 2.1-inch long × 1.0-inch wide tear in the right rear of the hood. The windshield was cracked, but there was no tear or hole. No measurable exterior crush to the vehicle was noted (other than the above mentioned hood damage), and no occupant compartment deformation or intrusion was noted. MASH does not require instrumentation of the vehicle for tests of traffic control devices weighing less than 220 lb, thus, the occupant risk factors were not calculated for this test. The device performed acceptably for MASH test 3-72 with an impact angle of 0°.
Full Scale Crash Testing was done in compliance with MASH by the following accredited crash test laboratory (cite the laboratory’s accreditation status as noted in the crash test reports.):

ATTACHMENTS

Attach to this form:
1) Additional disclosures of related financial interest as indicated above.
2) A copy of the full test report, video, and a Test Data Summary Sheet for each test conducted in support of this request.
3) A drawing or drawings of the device(s) that conform to the Task Force-13 Drawing Specifications [Hardware Guide Drawing Standards]. For proprietary products, a single isometric line drawing is usually acceptable to illustrate the product, with detailed specifications, intended use, and contact information provided on the reverse. Additional drawings (not in TF-13 format) showing details that are relevant to understanding the dimensions and performance of the device should also be submitted to facilitate our review.
